

FGS Surveyors (fka: Florabama Geospatial Solutions, LLC) is an SBA HUBZone Certified Small Business Surveying & Mapping Firm with roots dating back over 80 years.

In January of 2018, Wayne Walker - founder and CEO of **FGS**, acquired and merged with GCT's Government Division, Inc. Then, in February of 2018, in order to strengthen resources and broaden **FGS'** nationwide foot-print, **FGS** acquired Riggs & Associates, Inc. located in West Plains, MO. **FGS'** Principal members have more than 125 years combined experience dating back to the late 1970's.

Today **FGS** is one of the more versatile surveying and mapping firms of its kind in Northwest Florida and South Central Missouri, specializing in the services such as **hydrographic surveying** using multi-beam and other state of the art equipment; ground control for all types of aerial data collection; construction stake-out with conventional and robotic total stations; high order static, PPK and RTK GPS; all types of **boundary surveys** and both mobile and terrestrial scanning.

We perform these services for private, state and federal clients across the United States. Our goal is to always provide a high-quality product for a reasonable price in a timeframe that meets the client's needs. All surveys are prepared in accordance with applicable Survey and CADD standards, and all survey parties are under the direct supervision of a licensed land surveyor responsible for reviewing survey data on a daily basis.

FGS Employs Four Professional Land Surveyors, as well as a Surveyor in training (LSIT), a Certified Hydrographer, Two Certified Federal Surveyors (CFedS), multiple FAA Certified Remote Pilots and numerous Certified Survey Technicians at varying levels of certification. Our personnel have worked in 38 States across the country, in addition to Puerto Rico and Haiti.

AREAS OF EXPERTISE

Boundary/Cadastral

We perform all types of boundary surveying services. These services include boundary surveys from the small mortgage survey to a several thousand acre tract for both the private sector and numerous federal agencies.

Bathymetric/Hydrographic

Our hydrographic services include single beam (single and dual frequency), multibeam, magnetometer, side scan sonar, sub-bottom profiling and blueview scanning. These services are performed on platforms varying in size from ± 100 Vessels to 6' long, remote controlled boats.

Planimetric/Topographic

Like our boundary services, we perform topographic services on various sized projects. These surveys consist of pre and post design as-builts, volumes for payment and many more.

Geodetic/GPS

These services include new control monument installation, high order static GPS observations & digital leveling, blue-booking, OPUS Projects, RTK GPS using conventional & VRS base stations.

Mobile/Terrestrial Scanning

FGS maintains the latest technologies such as high definition scanning. We use mobile scanning from platforms such as normal vehicles; various sized ATV's and boats.

Mean High Water/Riparian

Mean High Water Line Surveys are a common practice when you have an office located in a coastal county. These surveys are often tied to Riparian Rights issues as well.

UAS Capabilities

FGS utilizes drones and fixed-wing platforms for projects including orthophotography, plan/topo, construction monitoring, volumetric, as-built, and asset management of small to medium sized sites.

Federal and Large Commercial Clients

FGS Hydrographic Surveying Capabilities

Our in-house Certified Hydrographer and Technicians use the latest equipment and technology to perform high resolution hydrographic surveys. We utilize a variety of tools and skills to produce the detailed data you need to make informed decisions.

Our ability to verify data from scanning sonar or multibeam surveys is a key tool in the in-house capabilities of FGS. In addition, our hydrographic surveyors use real-time kinematic (RTK) positioning to broadcast to survey vessels, achieving centimeter-level vertical and horizontal accuracies. When remote geographic locations make this impossible, we use software to post-process the data to the same tolerances as RTK.

Our certified hydrographer and techs consult on a variety of dredging related issues, including preparation of specifications, pre- and post-dredging surveys, monitoring of siltation rates, volume calculations for payment quantities, and assistance in obtaining required local, state and federal permits.

These services are performed on platforms varying in size from ±100 Vessels to 6' long, remote controlled boats.

BATHYMETRIC/HYDROGRAPHIC SERVICES INCLUDE

Mean High Water/Riparian

Mean High Water Line Surveys are a common practice when you have an office located in a coastal county. These surveys are often tied to Riparian Rights issues as well.

Multibeam Hydrographic Surveys - Good for collecting depths in mid- to deep-water columns, multibeam hydrographic surveys can serve two purposes: berth clearance and condition surveys.

Dual-Frequency Single Beam Surveys - We use dual-frequency single beam surveys to determine water depth by measuring the travel time of a short sonar pulse, or “ping”. Hydrographic survey-grade single beam echo sounders are able to provide accurate bottom depths by distinguishing the real bottom from false readings caused by fish, debris, aquatic vegetation and suspended sediment.

Scanning Sonars - This tool is used for object detection, sending out a sound wave that reflects off objects and can be used regardless of water visibility.

Side Scan Sonars - Used for object detection, side scan sonar measures the strength of returning echoes to create an image of the sea floor.

Sub-Bottom Profiling - Using principles of seismic reflection, sub-bottom profiling can identify and characterize layers of sediment or rock under the sea floor.

ROV Operations - We utilize remotely operated vehicles (ROVs) to investigate areas where divers cannot operate safely.

Magnetometer - This instrument, used for measuring the magnitude and direction of a magnetic field, can detect magnetic anomalies beneath the surface.

These services are performed on platforms varying in size from ±100 Vessels to 6' long, remote controlled boats.
